THE NEW BRUNSWICK GRADUATE FOLLOW-UP SURVEY REPORT - 1989

91-04275/

Dear Reader,

I take great pleasure in sharing the results of the 1989 Graduate Followup Study with you.

For this year's survey we introduced a number of amendments. First, we **conducted the survey by telephone**, replacing the traditional summer long mailout survey. This was a great success. The poll was completed within two weeks of the early March "reference" week, when events were fresh in respondents' minds. The results show a better sampling. We were also able to use the results in the Department's planning activity, several months earlier than usual.

The second amendment was to **ask graduates what they thought of their training experiences**. We asked them to rate not only the program and how it prepared them for a job, but also the facilities, equipment and quality of instruction. This information proved both useful and enlightening. You will notice we have included these evaluations alongside the labour market results for every programme. We believe this feedback to be valuable, and we plan to continue seeking this type of input.

Finally, we experimented with **a new report format**. While the report begins with the global labour market results, it then includes comments about the graduates. We look at who they are, the period of time they looked for employment, and what variables appeared to affect their success in the labour market. Finally the report concludes with factsheets about the placement for each program.

I hope you find this report as exciting to read as it was for us to produce.

The cooperation of our graduates in responding to the annual survey is gratifying. We thank them for helping us, and wish all graduates the very best in their future.

Sincerely,

Léonard Arsenault

LÉONARD J. ARSENAULT
DEPUTY MINISTER
N.B. DEPARTMENT OF ADVANCED EDUCATION AND TRAINING

THE NEW BRUNSWICK GRADUATE FOLLOW-UP SURVEY REPORT

1989

Prepared for Planning Services
N.B. Dept of Advanced Education & Training

Prepared by Martha E. Patterson
Facts & Figures Research Services

Date: December 15th, 1989

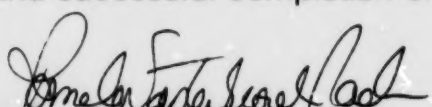
FOREWORD

Each March we ask graduates of the previous June how well they fared in the labour market. These Annual Graduate Followup Survey results comprise our annual report card for our fulltime regular training programmes. We take the information seriously, and integrate it into our future planning activities.

This year's report was very innovative for us. Some of our most crucial planning is undertaken in the summer. Thus, it is desirable to have the "dernier cri", or most up to date graduate survey information possible at that time. The telephone survey allowed for this. Our polling was completed by early April, three weeks after it began. Key indicators were ready for us by the summer, the entire report by year end.

We also asked graduates their opinions about their training. This information is as useful as the labour market feedback, and we are quickly integrating it into our long term planning activities.

I wish to express my sincere appreciation to both Baseline Market Research for their heroic completion of close to seventeen hundred (1694) telephone interviews in a three (3) week period, and to Facts & Figures Research Services for their uncompromising commitment to quality. Both agencies were flexible and cooperative in their dealings with us, contributing to a swift and successful completion of the entire project.



Pamela Easterbrook-Nadeau

INDEX 33

SURVEY BACKGROUND

Every March the New Brunswick Department of Advanced Education & Training conducts a follow-up survey of the graduates of its full-time regular training programs (at least twenty weeks in duration) at all nine of its community colleges. Graduates are asked a series of questions concerning their labour market experiences since graduation.

The 1989 survey brought with it a number of changes from previous years.

Revised Questionnaire

Firstly, the questionnaire itself was revised. Some questions were deleted and others re-worded. New to this year's survey was the inclusion of program evaluation questions. What were the graduates' opinions of the training they received?

Telephone Survey

Secondly, the survey was carried out by telephone rather than the traditional mail-out. Thus, all surveys were completed over a period of three weeks as compared to two - three months.

Earlier Analysis

Thirdly, survey results were available for analysis at a much earlier date. In addition to the telephone survey, a number of other factors contributed to this: fewer questions for coding, an improved format for keypunching plus less reliance upon the mainframe and its applications. Data reports were generated using dbaseIV and Framework.

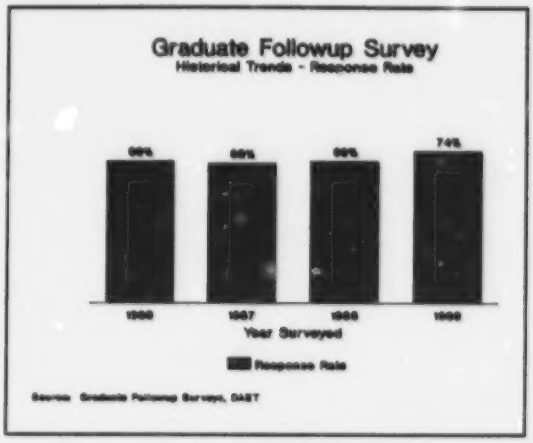
This Report

This report begins with the profile of survey respondents followed by an overview of the survey results. Factsheets are provided for each college, cluster and program as well as a summary factsheet. The factsheets are accompanied with a User's Guide. Finally, the report concludes with summary tables.

Response Rate

The response rate of the graduate follow-up survey has hovered between sixty-eight percent (68%) to sixty-nine percent (69%) for the past five years. However, with a telephone survey, the response rate increased to seventy-four percent (74%). There were a total of twenty-two hundred and ninety-three (2293) graduates in the survey population; sixteen hundred and ninety-four (1694) participated in the survey.

Another benefit of the telephone survey was improved sampling distribution. The telephone survey aimed for a response rate of seventy percent (70%) across all sectors as well as a proportional response rate by gender. This permits us to talk about "graduates" when making observations about their labour market success, rather than saying "survey respondents" as before.

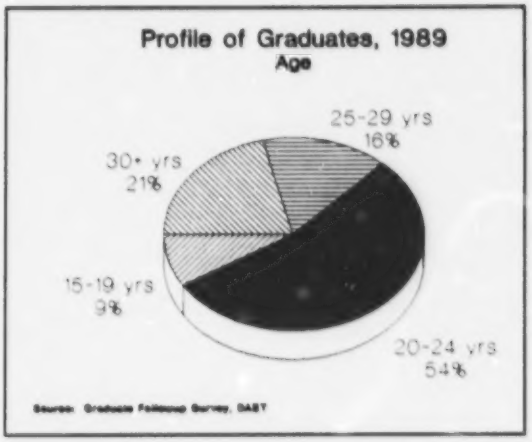


CHANGING PROFILE OF GRADUATES

The changing profile of graduates reflects the changing demographics of the population. The traditional college population of young, single, high-school educated students is being replaced with an older, more experienced and more settled population.

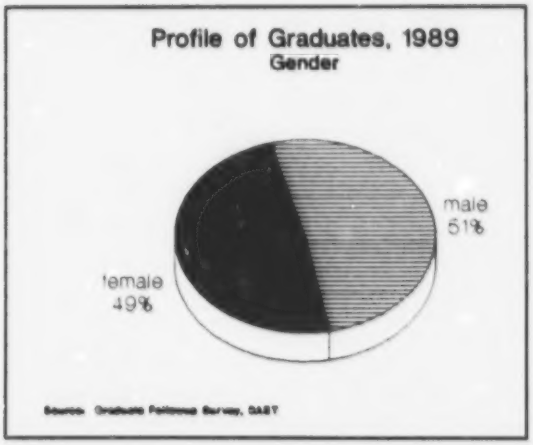
Age

More than half (54%) of the graduates participating in .he survey were 20 - 24 years old. Interestingly, the next largest group were those thirty years of age and older (21%).



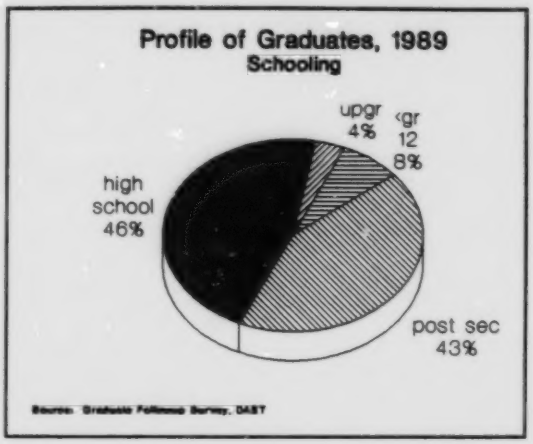
Gender

There was an even mix of male and female graduates.



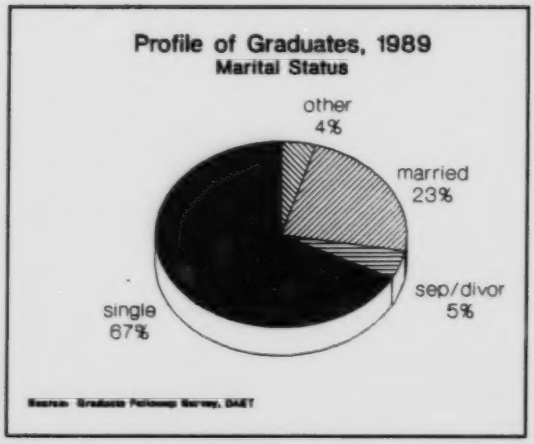
Schooling

Traditionally the majority of people coming to Community College would be recent high school graduates. However, as the chart shows, more than forty percent (43%) of the graduates in the survey had already taken some post-secondary training, before registering for their present course.



Marital Status

While two-thirds (67%) of graduates were single, this has been gradually declining year-to-year. More than twenty percent (23%) of graduates in the survey were married. Furthermore, one-quarter of participants in the survey had dependents (not illustrated).

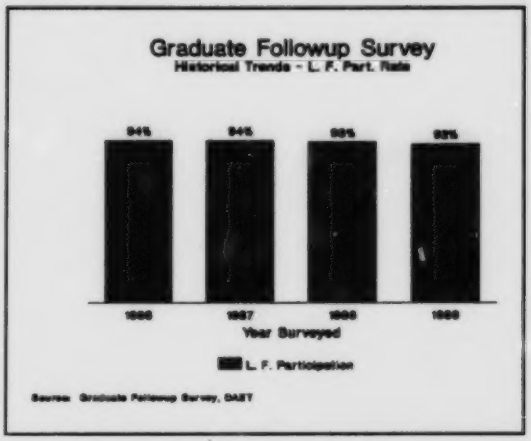


LABOUR FORCE PARTICIPATION

The labour force participation rate of NBCC graduates is very high, and considerably higher than the overall N.B. rate of approximately sixty percent.

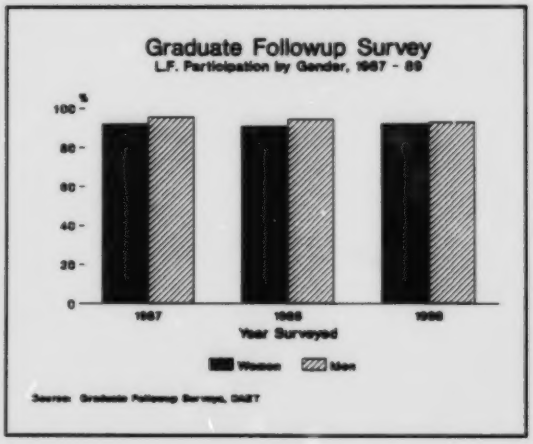
Since the beginning of the survey, it has been ninety-four percent (94%), except over the past two survey years. The rate declined by one percentage point in 1988 to ninety-three percent (93%) and then, again, this survey year to ninety-two percent (92%).

Thus, eight percent (or 132) of the graduates were not in the labour force. **More than eighty percent of them were studying full-time.** The others were not in the labour force because of illness/disability or personal/family responsibilities.



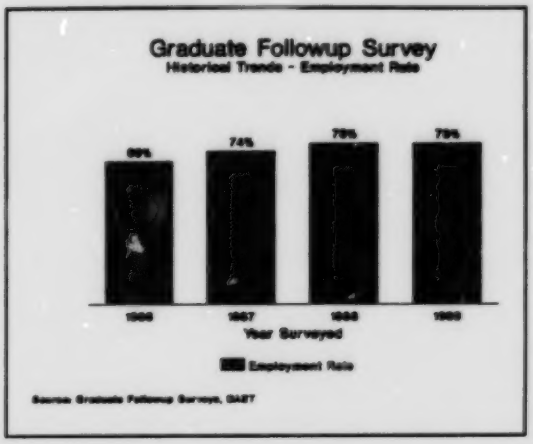
Gender

The labour force participation of men has declined over the three-year period of 1987 - 1989. Women's, on the other hand, is rising. The gap between the participation rates of male and female graduates is narrowing.



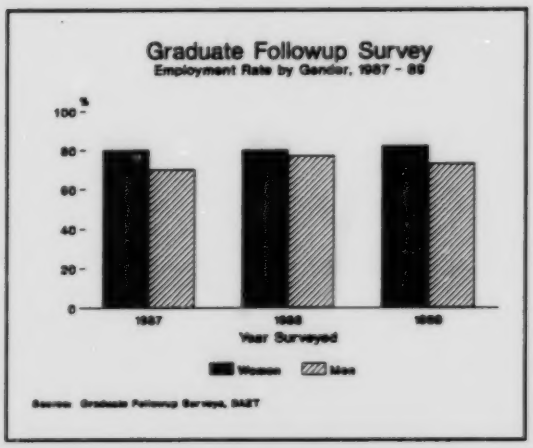
EMPLOYMENT

The employment level of respondents has been steadily increasing since the first survey in 1983 (59%). It reached a high of seventy-eight percent (78%) in 1988, which was maintained in the 1989 survey.

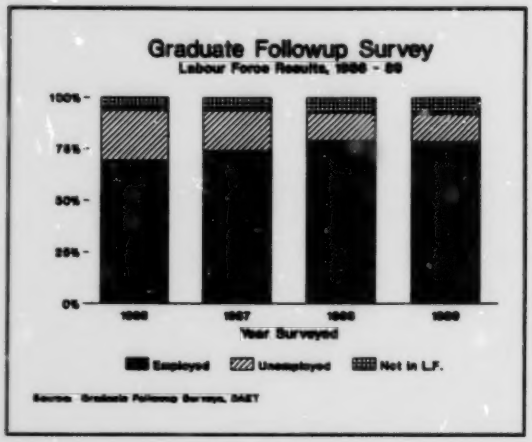


Gender

Women have reported a higher rate of employment than men for the past three years. They also reported an increase this year over last from eighty percent (80%) to eighty-two percent (82%). Mens' employment rate declined from seventy-seven percent (77%) in 1988 to seventy-three (73%).

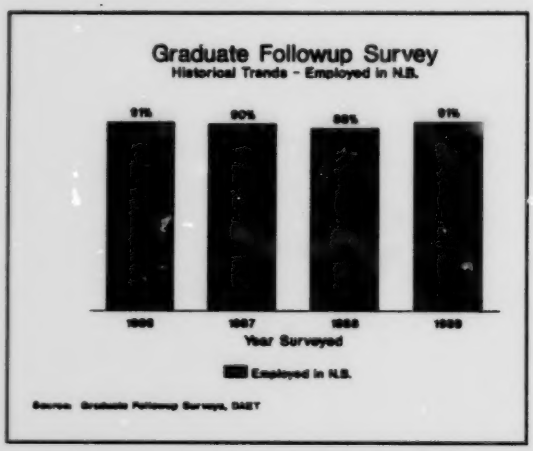


In summary, the labour force activity of graduates since the 1986 survey shows increasing employment and increasing non-labour force participation. Thus, the extent of unemployment being experienced by graduates is decreasing.



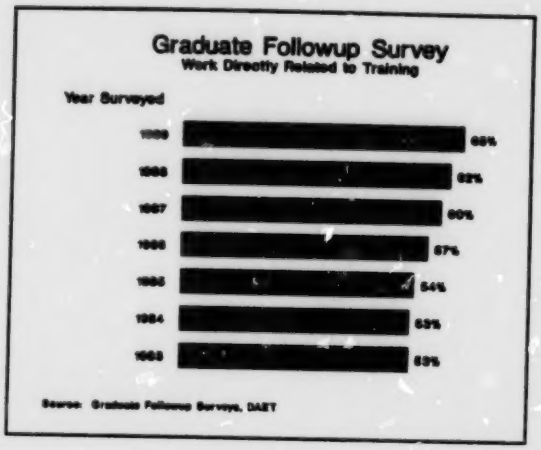
Employment In New Brunswick

Ninety-one percent (91%) of employed graduates were working in New Brunswick. This is an increase over the two previous surveys, and a return to the level of earlier surveys.



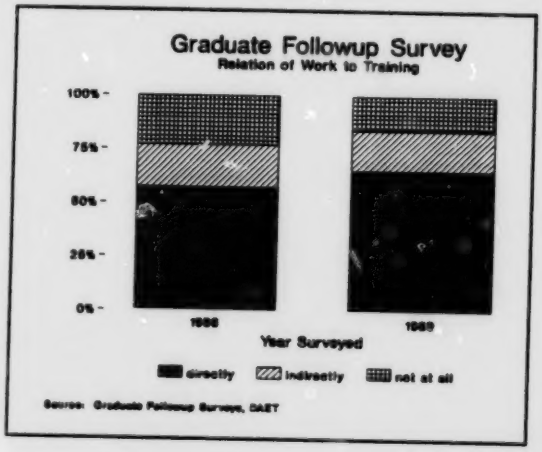
Relation Of Work To Training

Sixty-five percent (65%) of employed respondents had employment directly related to their training. This is a continuation of the steady improvement respondents have been reporting in their ability to put their training to use.



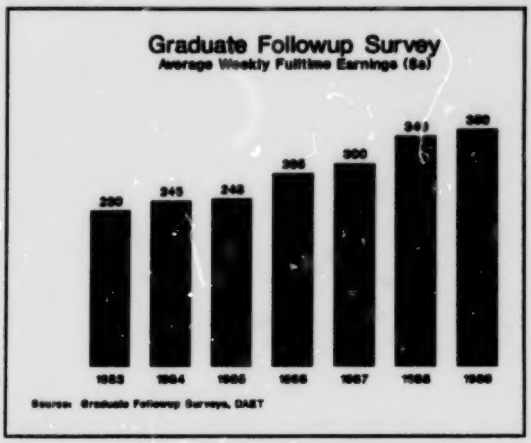
When directly related and indirectly related responses are added together, more than eighty percent of employed graduates had jobs related to their training. Jobs not at all related to training have been on the decline since 1984.

There was no difference between the responses of women and men with respect to the relation of work to training.



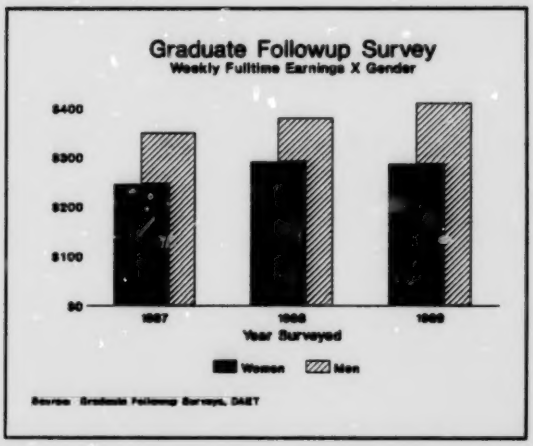
Average Weekly Full-time Earnings

Average reported full-time earnings have increased steadily from $230 per week in 1983 to $350 in 1989.



Gender

Female graduates earned less than male graduates. Women maintained their 1988 level of average full-time earnings in the 1989 survey at $285 per week. Men's reported earnings increased, rising to $410 per week in 1989 from $380 in 1988. Thus, in 1989, women's full-time earnings were seventy percent (70%) those of men's. This is a widening of the wage gap compared to the previous survey.



AGE

For the first time in the history of the Graduate Follow-up Survey, the age of graduates represents their age at the time of the survey.

15 - 19 year olds

The 15 - 19 year olds were the smallest age group (10% of all graduates). They had the lowest rate of participation in the labour force (89%) and the lowest employment rate (73%).

20 - 24 year olds

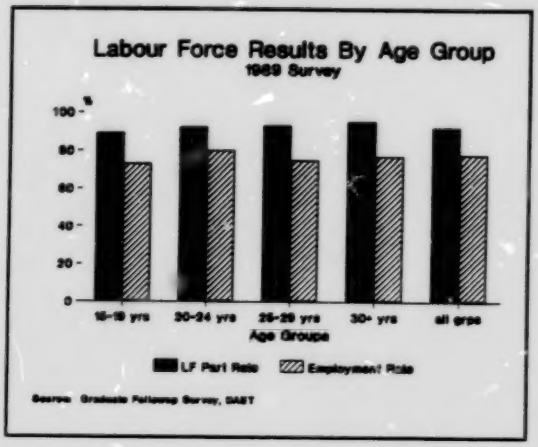
More than half (54%) of all graduates were in this age group. Their employment rate was the highest of all age groups (80%). Their labour force participation rate was average (92%).

25 - 29 year olds

Sixteen percent (16%) of graduates were 25 - 29 years old. Ninety-three percent (93%) of them were in the labour force. Three-quarters (75%) were employed.

30 years and over

More than twenty percent (21%) of all graduates were thirty years of age or older. The highest labour force participation rate (95%) of all groups was reported by these graduates. Their employment rate was seventy-seven percent (77%).

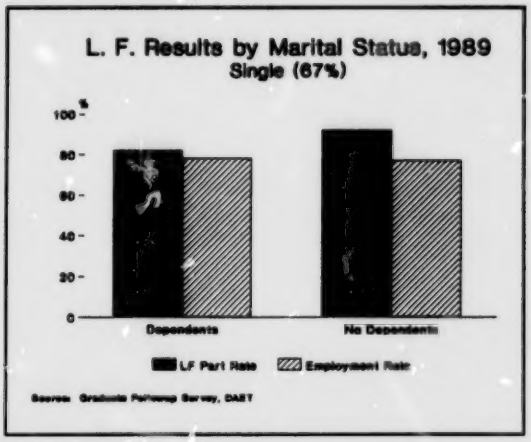


MARITAL STATUS & DEPENDENTS

As with "age", marital status is at the time of the survey.

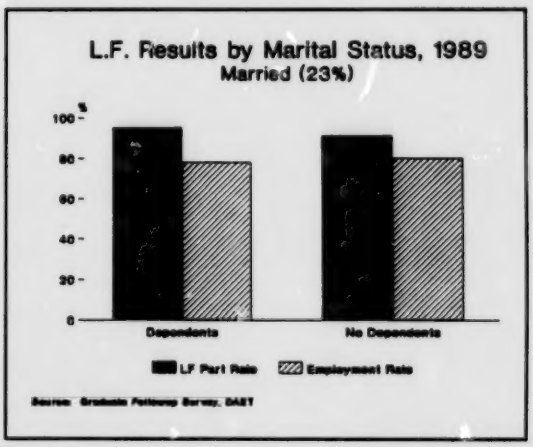
Single

Two-thirds (67%) of all respondents were single, never married. Of these, only six percent had dependents. The graduates with dependents had the lowest labour force participation rate of any group at eighty-two percent (82%).



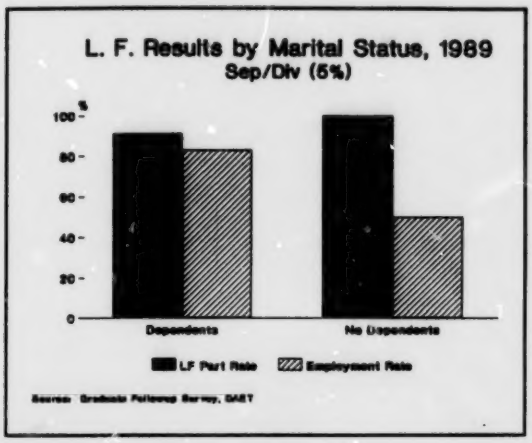
Married

The next largest group by marital status were married respondents (23% or 395). Two-thirds (67%) of them had dependents. Those with dependents had a higher labour force participation rate (95%) than those without (91%).



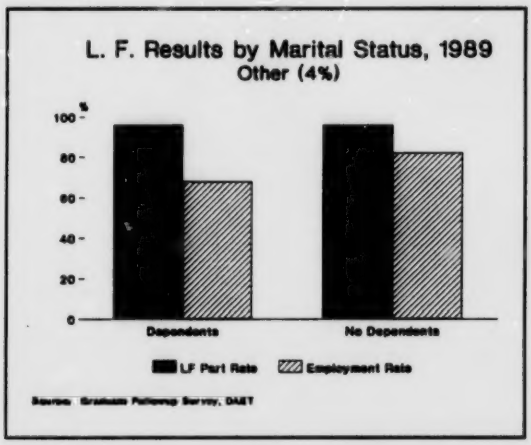
Separated/Divorced

Five percent (5%) of all graduates were separated or divorced. More than eighty percent (83%) had dependents. The highest and lowest employment rates were reported by this group, 83% with dependents and 50% without dependents.



Other

The other three groups combined, i.e., widowed, other and unknown, represented fewer than five percent of all respondents.

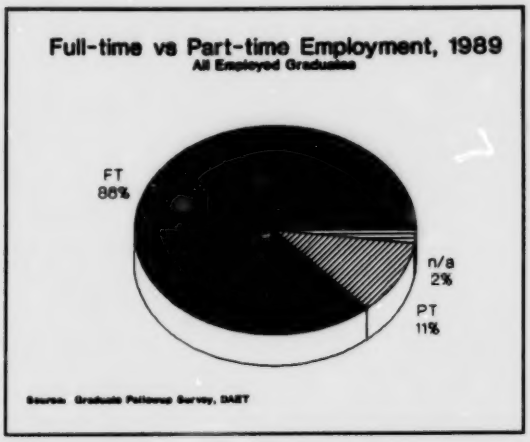


Dependents

Three-quarters (75%) of all graduates had no dependents. There was no difference between the employment rate of those with dependents (78%) and those without (77.5%).

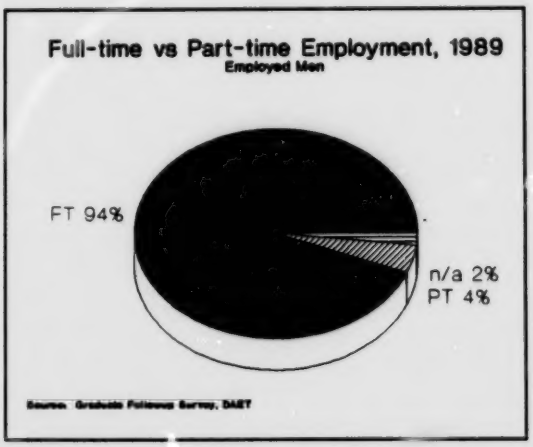
JOB STATUS

Eighty-six percent (86%) of all employment was full-time. Part-time employment increased to eleven and a half percent (11.5%) of all employment, a rise from seven percent (7%) in the 1988 survey.

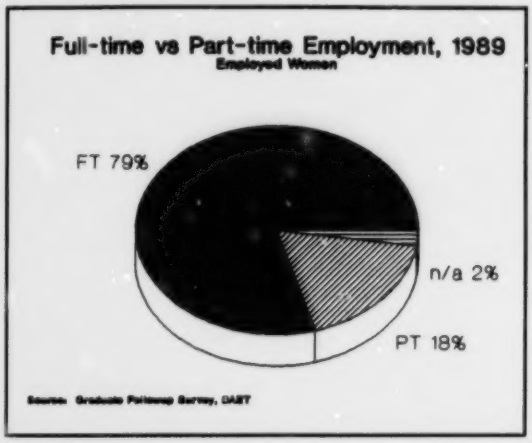


Gender

More than ninety percent (94%) of employed men were working full-time while seventy-nine percent (79%) of employed women had full-time positions.



Of those graduates working part-time, more than eighty percent (81%) were female.



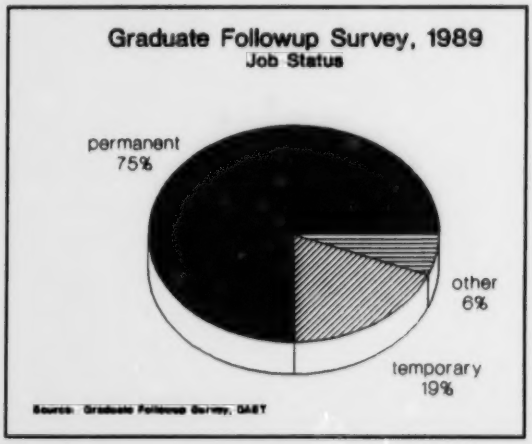
Relation of Work to Training

The 1984 National Graduate Follow-up Survey found that graduates working full-time were more likely than part-time workers to have jobs related to their course of study. This trend is supported here. In the 1989 NBCC Graduate Follow-up Survey, fourteen percent (14%) of graduates employed full-time had positions not at all related to their training compared to thirty-two percent (32%) of those working part-time.

Permanency of Work

This year's survey also queried graduates as to their employment status. How many had permanent jobs? Temporary? How many were self-employed?

Three-quarters (75%) of all employed graduates had permanent jobs. Only one percent (1%) were self-employed.



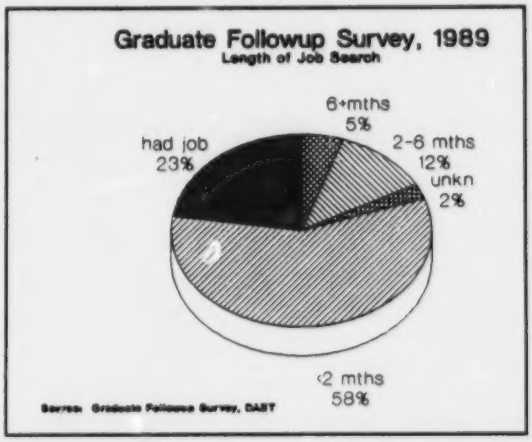
JOB SEARCH

Re-designing the survey questionnaire permitted the inclusion of some new questions concerning the school-to-work transition. The length of time it took graduates to find employment gives some indication of how readily the labour market can absorb the influx of new skills.

The length of time at present job also provides some information on job stability.

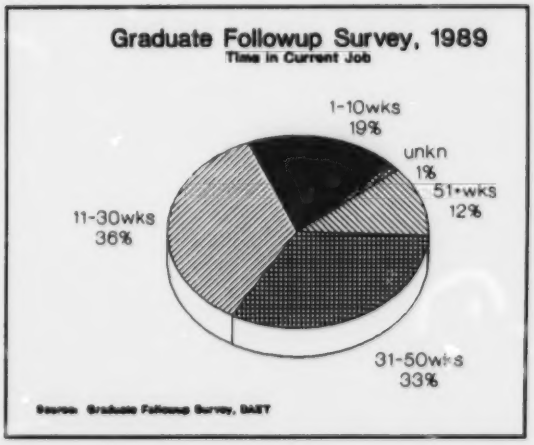
Job Search

More than eighty percent (81%) of the employed graduates either had their present job before they completed their course or found it in less than two months.



Time in Job

Forty-five percent (45%) of graduates had been at their present job for at least thirty-one (31) weeks. Assuming a June 30th graduation, this means they had begun work in early August at the latest. Two-thirds (67%) of all employed graduates had been at their jobs for at least five (5) months. These numbers correspond fairly closely with their reported job search, taking into account the difficulty of recalling exact dates and the likelihood of different course completion dates. Therefore, there is no strong indication of job-hopping.



SURVEY RESULTS By COLLEGE

Survey results by college show the range of possible experiences for graduates.

Response Rate

Response rates had a spread of thirty (30) percentage points from sixty-two percent (62%) in St. Andrews to ninety-two percent (92%) at Dieppe. Difficulty with phone numbers contributed to the lower response rate for the St. Andrews college.

Labour Force Participation

Only Edmundston (85%) and Miramichi (37%) had labour force participation rates below ninety percent. Moncton and Saint John graduates had the highest participation rates, both at 95%.

Employment

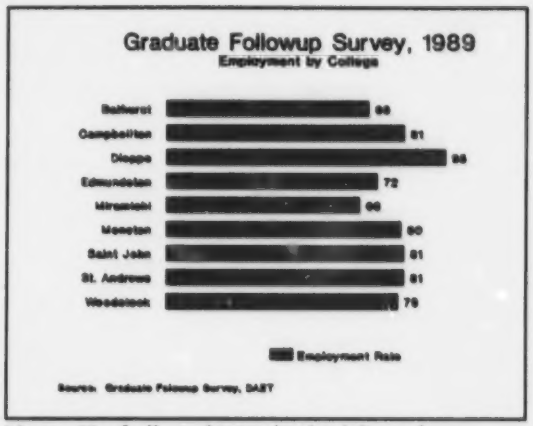
Employment rates ranged from sixty-six percent (66%) for Miramichi graduates to ninety-five percent (95%) for Dieppe graduates.

All colleges, except Edmundston, Moncton and St. Andrews, had more than ninety percent (90%) of their employed graduates working in N.B.

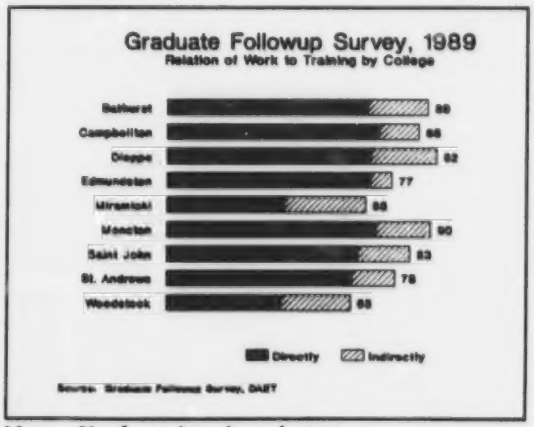
Related Employment

Related employment includes work directly and indirectly related to training. Graduates of the Dieppe (92%) and Moncton (90%) colleges had the greatest success in finding related work. Greater difficulty was experienced by Miramichi (68%) and Woodstock (63%) graduates.

More detailed results by college are available in the Factsheets.



Note: % of all graduates in the labour force



Note: % of employed graduates

SURVEY RESULTS By CLUSTER

All programs offered at the community colleges belong in one of eighteen clusters. In 1989 programs from sixteen clusters were surveyed.

Labour Force Participation

Only four clusters had fewer than ninety percent (90%) of their graduates in the labour force. Protective Services had the lowest participation rate (78%). Health/Community Services had the highest participation rate at 97%.

Employment

Business (90%) had the highest employment rate. Electronics (89%) and Drafting & Design (88%) were close behind. Wood & Related Materials reported the lowest employment (58%). Metals, Mechanical - Motorized Equipment and Construction also reported low employment.

Health/Community Services reported the highest percentage (100%) of graduates working in New Brunswick, followed by Personal Services (98%). Four clusters had more than twenty percent of their employed graduates working outside of New Brunswick: Applied Arts & Communication (79%), Mechanical - Industrial (78%), Mechanical - Motorized Equipment (79%) and Electronics (78%).

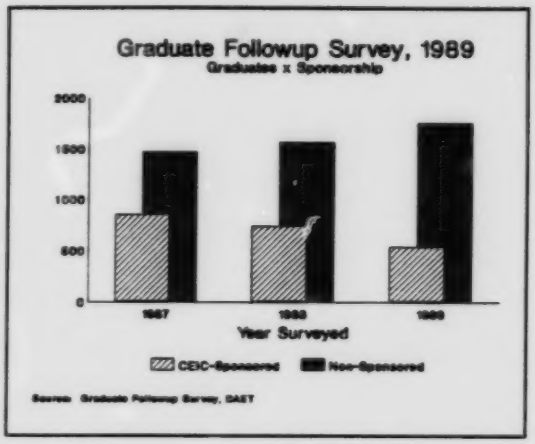
Related Employment

The following clusters had strong results for work related to their training: Business (92%), Protective Services (91%), Mechanical - Industrial (91%) and Health/Community Services (90%). Heating, Ventilation & Air Conditioning (67%) and Wood & Related Materials ((67%) gave a weaker showing.

More detailed results by cluster are available in the Factsheets.

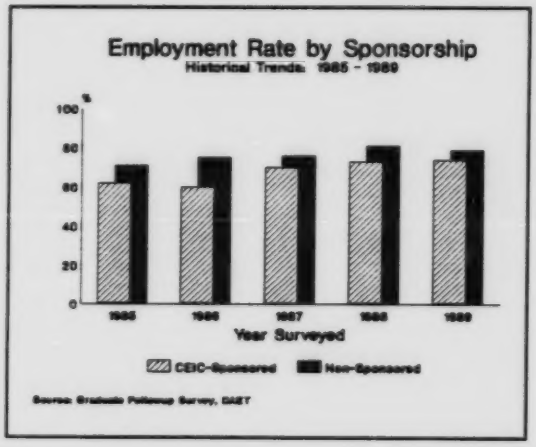
SPONSORSHIP

Students are divided into five possible categories with respect to sponsorship: non-sponsored, CEIC-sponsored, other sponsored, industry sponsored and fee payer. The last three categories only represent six percent (6%) of the survey population. However, they are representing an increasingly larger proportion of the survey population each year. For the purposes of this analysis, these three categories are added in with the non-sponsored category.



CEIC-Sponsored and Non-Sponsored

As was pointed out in last year's report, a decreasing proportion of students each year have their training sponsored by Canada Employment and Immigration (CEIC). This year twenty-three percent (23%) of the graduates in the survey population were CEIC-sponsored, compared to thirty-two percent (32%) the previous survey year.



Employment Rates

As in past years, non-sponsored graduates had a higher employment rate (79%) than CEIC-sponsored graduates (74%). However, the difference between the two groups is narrowing.

OCCUPATIONS

Employed graduates were working in more than 160 different occupational categories, as identified by the Standard Occupational Classification 1980. More than forty percent (43%) of employment was in ten occupational categories. Seven of the ten categories identified were also in the top ten list of the 1988 graduate follow-up survey.

Women

Women do not exhibit as much occupational diversity as men. Sixty-four percent (64%) of all employed women worked in ten occupational categories. This is an increase over the previous survey (60%), showing even less diversification.

Men

The top ten occupational categories reported by men accounted for approximately forty-two percent (42%) of all their employment. This, too, shows less diversity over the 1988 survey (40%).

INDUSTRIES

More than fifty percent (52%) of all reported employment was located within ten industrial categories. In the 1989 survey there were 64 different industrial classifications, as identified by the Standard Industrial Classification 1980.

Health & Social Services

Fourteen percent (14%) of all employed respondents had jobs in the health and social services field.

Women

More than sixty percent (64%) of employed women worked in ten 10 industrial classifications. One-fifth (21%) were employed in the health & social services field. Eight of these categories were the same as those in the 1988 graduate survey. Again, as in the previous year's survey, all were in the services-producing sector.

Men

More than half (54%) of all employed men worked in ten industrial categories. Unlike women, the top ten industrial categories for men included three in the goods-producing sector.

FURTHER STUDY

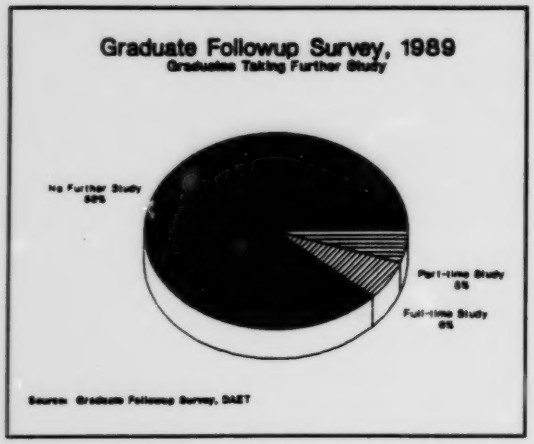
Twelve percent of all graduates (or 199 graduates) were continuing their education. This has been gradually increasing over the past three survey years from ten percent (10%) in 1987 to eleven percent (11%) in 1988, and now twelve percent (12%) in 1989.

Reasons

Forty percent (40%) of these graduates wanted to upgrade their existing skills. Eighteen percent (18%) wanted to get a better/more interesting job.

Full-time Study

Fifty-five percent (55%) were studying on a full-time basis. This is a slightly lower percentage than last year's 58%.



Programs

One-quarter of all programs (26) had twenty percent or more of their graduates taking further training.

Programs with largest number of graduates taking further study

Stenographer	26
Business Technology - Accounting	12
Clerk Typist	12
Welding	12
Motor Vehicle Repair (Mechanical)	9
Correctional Services Worker	7
Machinist	7
Steel Fabrication	5
Carpentry	5
Business Technology - Marketing	5

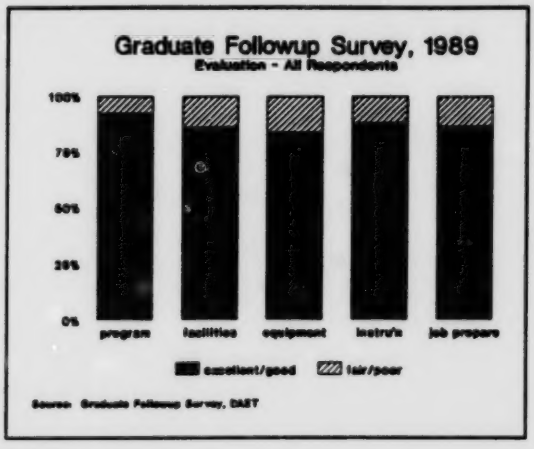
PROGRAM EVALUATION

For the first time, graduates were asked to evaluate their training according to program content, facilities, equipment, quality of instruction and preparation for a job.

Overall Evaluation

More than eighty percent of all graduates rated their programs as excellent or good for each of these categories. Program content (92%) received the most positive feedback, equipment the least (83%).

When asked for their overall impression of their program, more than ninety percent (92%) considered their training to be excellent or good.



Cluster

There were variations by cluster. Graduates of programs in the Protective Services (97%), Personal Services (97%) and Metals (96%) had very favorable impressions of their training. Less enthusiasm was expressed by graduates from programs in the Applied Arts & Communication (81%) and Heating, Ventilation & Air Conditioning (83%) clusters.

Program evaluation results for each college, cluster and program are located in the Factsheets.

USER'S GUIDE TO FACTSHEETS

Again this year, factsheets have been prepared for each college, cluster and program as well as a summary factsheet. The overall survey results will be followed by the college factsheets and then program factsheets organized by cluster.

The following interpretative notes outline for readers the information they will find in each factsheet and what it represents.

LOCATION: The college(s) where the training took place will be identified for the program factsheets only.

NOTES: This section provides a written commentary for each factsheet, highlighting significant findings. Any references to part-time employment or further study will be made in this section.

SURVEY POPULATION: The number of graduates surveyed by gender and those who participated are identified in this section. A response rate has also been calculated.

LABOUR FORCE RESULTS: All survey participants are categorized according to their reported labour force activity. Depending upon their answers, respondents are classified as either employed, unemployed or not in the labour force. "Not in the labour force" is defined as anyone who is studying full-time, or not working because of illness/disability or personal/family responsibilities. All other respondents who are not currently working are considered to be unemployed.

The labour force is the sum total of the employed and the unemployed. The employment rate is determined by dividing the employed respondents by the total labour force, expressed as a percentage. The unemployment rate, therefore, is calculated by dividing the unemployed respondents by the total labour force, expressed as a percentage.

EMPLOYMENT: This section has been expanded this year to include information not available for the previous year's factsheets. All percentages in this section are with respect to total employed.

Employed participants are asked several questions concerning their job. Here location of work, employment status, type of employment, the relationship between their job and their training and wage information are presented.

Any respondent working more than 29 hours per week is considered to be working full-time. Average weekly earnings for full-time employment are presented. Not all respondents provide wage information. The number that do is located next to the figure for average weekly earnings. The average number of part-time hours is also presented along with the number of graduates working part-time.

PROGRAM EVALUATION: For the first time, the graduate follow-up survey asked graduates to evaluate their training according to program content, facilities, equipment, quality of instruction and preparation for a job. This table presents the percentage of graduates who rated these variables as either excellent or good.

MOST COMMON OCCUPATIONS: The three most common occupations for each factsheet are given.

MOST COMMON INDUSTRIES: The three most common industries for each factsheet are given.

UNEMPLOYMENT: The unemployment respondents are asked the reason for their jobless state. The three most common reasons are given along with the number of unemployed respondents indicating that particular response.

NOTES

The survey response rate increased to 74% using a telephone survey. Employment held steady at 78%. Ninety-one percent of graduates were working in N. B., up from last year's 88%. Fifty-eight percent of graduates had full-time jobs directly related to their training. Twelve percent of all respondents were taking further training. Program evaluation results are new this year.

NOTES

Eighty percent of the graduates from this college participated in the survey. Their labour force participation rate (85%) was below the survey average (92%). The employment rate was also below average. More than sixty percent of graduates had full-time jobs directly related to their training. Overall, students rated their program below the survey average, particularly equipment.

GRADUATE SURVEY 1989

Campbellton

NOTES

Sixty percent of the graduates of this program participated in the survey. All were in the labour force, eighty-two percent employed. Two-thirds had full-time jobs directly related to their training. Two graduates were taking further study. All graduates considered the program content and equipment to be either excellent or good. Job preparation received the lowest rating.
